

My first year with chickens

A week-by-week guide to
a happy, healthy flock

FEED GREATNESS™

Welcome to raising chickens.

Congratulations on your new chicks! It's time to bring them home and quickly fall in love.

This year will be filled with many milestones for your family to celebrate—from watching your chicks grow and gain their feathers to building a coop together and then celebrating your first farm fresh egg. You are in for a year of many firsts—and, most excitingly, a year of fun!

Raising backyard chickens is especially exciting when you have a partner in the process. That's why we created this guide. Keep this book handy as your chicks grow. You can simply flip to the pages that match your chicks' age for quick tips on what to do each week.

We learned many of these tips from our own backyard coops on our farm in Missouri. Our Ph.D. nutritionists, feed formulators and flock caregivers work with our backyard chickens each day. For us, life is just better with chickens.

We love spending time with our flock and hope you will too. If you have any questions as you go, please connect with us online or stop by your local Purina® retailer. We are happy to be with you each step of the way.

Enjoy the journey!

Before chickens:

Make sure chickens are allowed.

Before buying your first chicks, make sure they're allowed where you live. Many townships, villages and cities have embraced the benefits of backyard flocks; however, chicken keeping is not yet permitted everywhere. Talk with your city representatives to learn of any chicken ordinances and local laws. Ask for a file to keep on hand. Then, share the good news with your neighbors.

Questions to ask your city officials before buying chickens

- ✓ How many birds are allowed?
- ✓ Are both hens and roosters acceptable?
- ✓ Are there rules on where the coop can be built?
- ✓ What do I need from my neighbors before starting?
- ✓ Do I need a permit to raise chickens and/or build a coop?
- ✓ Who can I contact if I have to unexpectedly part ways with my chickens?

Think about where you'll keep your chickens once they are grown. Each bird will need 4 square feet of indoor space and 5–10 square feet of outdoor space when full-grown. See pages 14–17 for coop building tips.

Determine the number of birds you'd like.

The number and gender of birds in your flock hinges on your local ordinances and flock goals. Remember that young chicks grow into full-grown birds. Create a budget for: the time you can spend with your flock, bird housing needs, a plan for egg collection and use, and what you'll do with the birds when they retire. Then start small with a flock of 4 to 6 chicks.

Choose your breed.

There are hundreds of backyard chicken breeds. Some have fancy, colorful feathers while others can produce up to 300 farm fresh eggs each year. With a match for everyone, the fun part is selecting the breed that's right for you.

To pick your perfect poultry pal, outline your flock goals and climate. Will you be raising chickens for eggs, meat, show or pets? And, do you live in an area where it gets hot or cold?

A few popular chicken breed choices are:

Egg Layers	
	Ancona, Blue Andalusian, Campine, White Leghorn
	Australorp, Orpington, Plymouth Barred Rock, Rhode Island Red, Sussex
	Ameraucana, Araucana, Cream Legbar
	Marans, Penedesenca
	Barnevelder, Welsummer
Dual-Purpose	Rock, Jersey Giant, Sussex, Wyandotte
Meat Birds	Cornish Rock, Red Broiler, New Hampshire
Heat-Tolerant	Ameraucana, Leghorn, Minorca, Rhode Island Red, Turken
Cold-Tolerant	Araucana, Australorp, Mincorca, Orpington, Barred Rock, Wyandotte

What you'll need:

Now that you know the breed for you, it's shopping time! The most important starter supplies are for the chicks' first home, called a brooder. Bring this checklist to your local Purina® retailer to purchase supplies to keep your chicks comfortable.

Plan for your chicks' adult home as well. Chicks will move to the chicken coop at 6–8 weeks. Find more information about chicken coops on pages 18–21.

Checklist for new chicks

- Safe, clean, draft-free room or building
- Heat lamps and/or brooder stove
- Litter and/or shavings
(pine wood shavings ideal)
- Brooder guard
(circular and expandable, 3-4 sq.ft./chick)
- Feeders (4 in./chick)
- Waterers (One qt. waterer/12 chicks)
- Sanitizing solution
- Cleaning brushes
- Rake
- Pitchfork or shovel (for large areas)
- Egg flats or shallow pans
(Use first, then transition to feeders)
- 25-watt incandescent or equivalent
CFL or LED light bulbs
- Purina® Start & Grow® or Purina® Organic
Starter-Grower for laying chicks
or Flock Raiser® for broilers
- Thermometer

What to ask when getting new chicks

- Right breed for me?
- Male or female?
- Vaccinated or not?
- When should I switch to a layer feed?

Purchasing chicks:

Make sure chicks are from a credible U.S. Pullorum-Typhoid Clean hatchery that vaccinates chicks for Marek's Disease and coccidiosis.

You may be able to pick up chicks at your local Purina® retailer during Purina® Chick Days. You can also order chicks from a hatchery online or from a breeder. When purchasing, be sure to ask the correct questions, including: breed, gender and if the chicks are vaccinated.

Choosing a complete feeding program:

Your flock's feed will play a big role in their early growth, long-term health and the quality of eggs they produce. Map out a complete feeding program in advance. You will need one complete starter-grower feed for baby and growing chicks and one complete layer feed for when your birds turn 18 weeks old.

For both stages, look for a complete feed that is research-proven and made to match your flock goals. The complete feed will make up at least 90% of your bird's diet, so it should include all the nutrients they need at the correct levels, with no need to add any supplements.

See the next page for tips on selecting a starter-grower feed and pages 24–25 for pointers on choosing a complete layer feed.

For under 18 weeks

Pick one starter feed:

For over 18 weeks

Pick one layer feed:

Choosing a starter-grower feed:

Start your chicks strong by picking a complete starter-grower feed that matches their needs. Look for a complete feed that provides the nutrients they need to support their growth and high energy.

In your starter feed, look for: 18 percent protein to support early chick growth, vitamins and minerals for development and ingredients such as prebiotics and probiotics to support chick health.

What to look for in a starter-grower feed

18% protein, 1.25% calcium

Bone and body growth, energy

Prebiotics & probiotics

Immune and digestive health

Amino acids, like lysine and methionine

Skeletal, muscle and feather development

Marigold extract

Brightly colored beaks, shanks and overall appearance

Calcium, phosphorous & trace minerals

Bone strength

Vitamins A, D, E, K and B

Overall health and growth

Choosing a starter feed

Medicated vs. Non-medicated: Complete starter feeds come in two different formulas: medicated (with amprolium, this is not an antibiotic) or non-medicated. Base your decision on whether your chicks have been vaccinated for coccidiosis. Feed a medicated starter feed to chicks not vaccinated for coccidiosis and a non-medicated starter feed to chicks who were vaccinated for the disease. If you are unsure that the chicks were vaccinated, then choose the medicated starter feed.

Ducks, geese and mixed flocks:

For meat birds and mixed flocks (ducks, geese and other non-laying poultry): feed Purina® Flock Raiser® crumbles from day 1 through adulthood.

Setting up the brooder

The chicks are almost here! Prepare by setting up a brooder at least 24 hours in advance.

1. Disinfect all materials prior to use. Choose a disinfectant that is safe for animals and doesn't leave a residual film. A mixture of 10 percent bleach and 90 percent water can work well. Rinse thoroughly. Keep disinfectants handy so you can clean materials weekly.
2. Place your brooder in an area that is warm, draft-free and near electricity.
3. Set up your brooder. Provide at least 3 to 4 square feet per chick in a brooder that is circular and expandable. Avoid having square corners as chicks could get trapped.
4. Add absorbent wood shavings to the floor of the brooder, 3 to 4 inches deep, to keep the area dry and odor free. Do not use cedar shavings or other types of shavings that have a strong odor. Remove wet bedding daily, especially around waterers.
5. Assemble a heat lamp about 20 inches above the bedding in the center of the brooder. Provide 2.5 to 3 feet between the lamp and the guard walls so chicks can cool down if needed. The temperature under the heat lamp should be 95° F on day one. Once chicks arrive, you will adjust temperature each week.
6. Place starter feeders in the brooder. Provide 4 linear inches of feeder space per bird. Start with clean egg cartons or slips of paper as feeders for easy access. Have low-lying or trough feeders on hand for day two when you will transition from the starter feeders.

Visit your local Purina® retailer to see if they will have chicks in store during Purina® Chick Days.

7. Place your bag of complete starter feed in a place where it will stay dry, at room temperature and away from rodents. Feed should be available to the chicks at all times.
8. For every 25 chicks, fill two 1-quart waterers with room temperature water and place in the brooder. To help water stay at room temperature, place the waterers away from the heat lamp. The first thing you should do when chicks arrive is teach them to drink by dipping their beaks into their water.

Week 1: Welcoming chicks home

Congratulations! Backyard chickens are now a part of your family. Your happy, healthy flock starts today. Now that your chicks are home, the main elements they need are: warmth, water and feed.

Warmth: Ensure the heat lamp you set up yesterday is working properly. Use a thermometer to confirm the brooder temperature is 95° F at chick level. Watch chicks closely for the first few hours to make sure the heat lamp isn't too close or too far away. If chicks gather around the perimeter, they're too hot. If they huddle under the heat lamp, they're too cold.

Water: Without a mother hen to teach chicks to drink, it's a good idea for you to show them. Dip each chick's beak into the room temperature water that you set up yesterday. Monitor the group to confirm all chicks are drinking within the first couple of hours.

Feed: Provide a complete feed with at least 18 percent protein to provide the necessary amino acids to support early growth. The feed should also include prebiotics and probiotics for immune health and vitamins and minerals to support bone health.

- For organic chicks: Purina® Organic Starter-Grower
- For layer chicks that have been vaccinated for coccidiosis: Purina® Non-medicated Start & Grow® feed
- For layer chicks that have not been vaccinated for coccidiosis or if you are unsure whether they were vaccinated: Purina® Medicated Start & Grow® feed
- For meat birds and mixed flocks: Purina® Flock Raiser® crumbles

Teach the chicks to eat by placing feed on clean egg flats, shallow pans or simple squares of paper. On day 2, add proper feeders to the pens. Once chicks have learned to eat from the feeders, remove the papers, pans or egg flats.

Consistent lighting: Provide 18–22 hours of light for the first week. Then, reduce light to natural day length throughout the growing period. At 16 weeks of age, increase day length to 16 hours per day. This will prepare the birds for egg laying. Use one 40-watt bulb for each 100 square feet (10' x 10') of floor space.

Bird handling: Build a bond with your chicks by gently holding and petting them each day. Spending time together can imprint chicks and help them form family-friendly personalities. Be sure to wash your hands with soap and water before and after handling the chicks.

Buff Orpington chick, Barred Rock chick

White Crested Black Polish chick

Week 2–3: Keep the growing going

Your chicks are growing—they are now two weeks old! You're probably noticing they are very social and can provide hours of entertainment. Each day, you will get to know their unique quirks and personalities.

Things to do this week:

Provide light: Expose chicks to natural day length or a minimum of 10 hours of light per day after the first week.

Adjust temperature: The biggest change you'll need to make this week is temperature. Older chicks do not need it to be quite as warm. Starting at week two, lower the temperature by 5° each week until you reach a minimum of 65°F at week six.

Temperature chart for your new chicks

Age of Chicks

Talk with your Purina retailer to learn about ideal temperatures for other poultry.

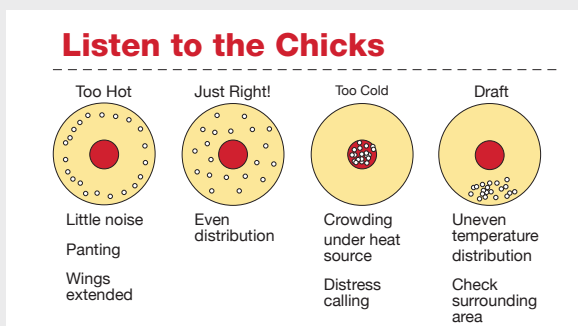

Remove brooder guard: Chicks should be able to find the heat source by day ten. At that time, you can remove the inside brooder guard if you have one.

Move feeders and waterers: After the brooder guard is taken out, move the feeders and waterers farther from the heat source. This will give chicks more space for exercise as they become more active. It can also help keep the feeders and waterers cleaner and from being heated by the heat lamp.

Remove training feeders: If you haven't done so by now, remove the training feeders. Make sure chicks always have complete starter feed and water. The level of feed in the feeders can be decreased a little each week until they remain at least half full. This will help reduce the amount of feed waste.

Keep it clean: Remove any foreign material in the feeders and waters on a daily basis. Wash the waterers once a week with soap and water. Keep bedding dry by removing wet and soiled litter each day and replacing it with clean, dry bedding.

Listen to your chicks: When everything is right, chicks will emit a soft cheeping. A chick that is stressed will have a shrill, higher pitched or very rapid cheep. Translate this as a call for help and look for the problem. Stress could be caused by chicks being too hot or cold, wet litter or they may be hungry or thirsty.

Week 3: Prepare the coop

Your chicks are changing each day and are likely filled with personality. In addition to the steps provided on the previous page, now is a perfect time to plan ahead.

Around week six, chicks will trade in the brooder for the coop. Be ready in advance by deciding on a location and design of their new home.

Coop location

Everybody loves a little “chicken TV” so be sure to place your coop near a window. This way, you can keep an eye on the flock when they’re playing in the yard.

Beyond a window view, answer these questions while location scouting:

1. Are there rules about where the coop can be built? Some cities have regulations about distance to neighbors, buildings, roads or property lines.
2. Is the environment calm and comfortable?
3. Is the spot flat? A flat area simplifies the process.
4. Does the area have good drainage?
5. Does the coop location provide both sun and shade for the birds?
6. Is the location close to utilities, including water, electricity and feed storage?

Coop design options

Once you've determined a location, consider your chicken coop design—we call this Coopitecture™. There are several types of Coopitecture™, so your first design decision is to choose a type of structure. Based on available space, selected breeds and your backyard goals, choose the type of housing that works best for you.

Chicken Tractors

Chicken tractors are best suited for small flocks that live in big yards. The structures are built similarly to a wheelbarrow, with two wheels and handles for mobility. Routinely moving the structure helps birds explore new areas, control insects and fertilize the lawn.

Chicken Wagons

Chicken wagons work well for those wanting a large, movable coop; for instance, if you have rotational pastures and a large flock. The wagons are on four wheels and include a ramp for birds to enter. The wagon can easily be moved to different paddocks or various parts of the yard.

Chicken Coops

Chicken sheds, or stationery coops with runs, are the most common form of coops. They work well in both rural and urban areas because they require minimal space and provide both outdoor and indoor access. This type of coop is easily maintained and the easiest to predator proof.

Check out our Coopitecture™ board on Pinterest for coop inspiration!

Coop considerations

Once you've determined your coop location and the design type, it's time to map out the logistics. Some flock raisers like to build their own coops with blueprints while others work with builders or purchase prebuilt coops.

When we built our 12 coops at the Purina Animal Nutrition Center, we worked with a coop builder. We focused on safety and comfort for our birds and convenience for our flock care team.

Here are a few points we kept in mind:

Space: Each bird should have indoor and outdoor access. Provide at least 4 square feet of indoor space and 5–10 square feet of outdoor space per bird. Account for additional space in case you add more birds to your flock later.

Access: The coop should be an enjoyable space for your family. Keep in mind your own height. Build the coop tall enough so that you can easily enter to take care of the flock. It's best if you can stand inside.

Ventilation: Fresh air is essential during all seasons. The coop should have windows on all four sides and ventilation holes at the top. Even if you live in a cold climate, don't completely seal the coop from fresh air as ammonia buildup can be hazardous to birds.

Electrical outlets: You may need electricity as birds get older. Outlets can be used to power additional lighting and automatic light timers as days get shorter, water heaters during the winter or fans during the summer. We suggest lighting incandescent 40-watt or LED 9- to 13-watt bulb per 100 square feet of coop space.

Predator-proof: Add screens to the doors, windows and runs. We used galvanized welded wire or hardware cloth instead of chicken wire. Chicken wire can stretch and allow predators access to the run. If your windows and doors have traditional mesh screening, be sure to add a layer of hardware cloth to those openings to prevent predators from getting in the coop. The opening in the wire mesh shouldn't be larger than ½" x ½".

We also buried galvanized wire underground to prevent burrowing predators. To do this, bury wire 6 inches underground, parallel to the walls of the coop and run. Then, bend the wire 90 degrees to run the wire out from the coop parallel to the ground for 12 inches. Finally, cover the wire with dirt. If a predator tries to dig under the coop or run, they hit the buried welded wire and stop digging.

An area for feed and water: Designate areas for feeders and waterers. It's a good practice to place the feeders and waterers in the run, so chickens eat outside and sleep inside. Don't forget about feed storage. You should have a place that keeps feed dry and away from rodents.

Roosts: Provide at least 1 foot of roosting space per bird for sleeping. Chickens like to sleep off the ground. A board that measures 2"x4", with the wide edge facing up can work well for a roost. Consider roosts for laying pullets and hens but avoid them for meat birds.

Nests: Build nesting boxes with easy access for egg removal. A general rule is to provide one 1-foot cube nest box for every four or five hens. The hens will take turns using the boxes. Keep the nests up off the floor in the darkest corner of the coop. On our farm, we built nesting boxes with outdoor access so that we can collect eggs without disturbing the hens.

See videos that feature our 12 backyard coops by visiting [PurinaMillsTV](https://www.youtube.com/PurinaMillsTV) on YouTube.

Weeks 4–5: The teenage stage

Your chicks are now in the ‘tween’ stage! In chicken years, birds are teenagers around 4 to 5 weeks old.

Soon you will notice several changes that include new primary feathers and a developing pecking order. Your birds are also now referred to differently. Pullet is the term for a teenage female while a young male chicken is called a cockerel.

Things to do this week:

Watch them change: Your chicks’ fluff should slowly disappear as mature feathers grow. Chickens will usually be fully feathered by 5 to 6 weeks of age. Their wattles and combs should also start growing larger and becoming a deeper red.

Identify the gender: At 5 to 7 weeks, you will be able to distinguish males from females. As compared to pullets, the combs and wattles of males often develop earlier and are usually larger. Females are typically smaller in size than males. If you are still uncertain of gender, you’ll be sure who the males are when you hear them attempting to crow.

Keep them in the brooder: Keep chicks in the brooder until week 6. Prevent crowding by ensuring 1–2 square feet per bird. The temperature should now be between 70–75°F to help them get ready to move outside. Your chicks require less heat because they are now larger and can better regulate their body temperature.

Adjust feeders/waterers: Additional feeders and waterers may be needed so all chicks can eat and drink at the same time. When evaluating feeders also look at space. Your chicks are taller, so their feeders should be as well. Place a container under the bottom of the feeder to keep feed and water clean. A good rule is to adjust feeders to the height of the bird's back while standing. This will help keep litter and curious chicks out of the feed and water.

Provide energy: Continue to offer a complete starter-grower feed, like Purina® Start & Grow®, Purina® Flock Raiser® or Purina® Organic Starter-Grower, to provide the added energy needed. Chicks should have access to free-choice starter-grower feed until week 18.

Keep an eye on the pecking order: As chicks mature, they naturally establish a pecking order. This determines each chick's social position in the flock. The pecking order will decide who eats and drinks first and ultimately who "rules the roost." Although pecking order establishment is normal, be watchful for excessive pecking in chicks as it may indicate a more serious problem.

Maintain good sanitation practices: Bigger chicks make bigger messes, so you will need to be more diligent about keeping the brooder clean. Keep a close eye on your chicks for signs of possible health issues. Chicks that are sick may appear lethargic or their feathers will be fluffed out from their body, have diarrhea or be unwilling to eat. Healthy chicks will eat and drink often and actively play as a group.

Weeks 6–8: It's coop time

Between weeks six and eight, your chicks will experience rapid growth and will need twice the floor space they started with. It's time to start the transition to the coop.

Here are a few tips to make the transition smooth:

Remove the supplemental heat: Most chicks can regulate their body temperature by now. If the outside temperature is above 65°F, they should no longer need a supplemental heat source.

Move brooder into the coop: Maintain consistency by carrying the brooder outside and placing it inside the coop. You can also use a portable pet carrier. Set the brooder or carrier in the coop, so chicks can take in their new surroundings.

Release chicks inside the coop: Open the brooder or carrier to allow chicks to explore the coop. Make sure you show the birds where the feed and water are. If you are containing the birds to one part of the coop, then be sure that they have access to feed and water.

Allowing chicks to free range: If you are going to let your birds wander outside of the safety of their coop and run, then they should be supervised until they are acclimated to their surroundings. Remember they are still easy prey for predators.

Keep it clean: Sanitation is still important. Remove manure, wet litter and old feed waste daily. Disinfect feeders and waterers weekly and occasionally clean and sanitize the coop with warm water and an appropriate cleanser.

Keep young birds separate from older birds until they reach the same size. This allows you to monitor the birds closely, prevent fighting and any possible illness from spreading to either group.

One way to help both groups acclimate to each other is to place the two groups in side-by-side runs. Place the groups next to one another for one week to help the birds become familiar with each other. This can also alert you to potential personality clashes that may be difficult to resolve.

Another strategy is to let the new group free-range first and then introduce the existing flock. This places the focus on new surroundings rather than new flock members.

In either case, add additional feeders and waterers to the run to prevent the new birds from being deterred from eating and drinking. During the introduction period, a new pecking order will be established.

Watch the group closely after the introduction.

Content birds will continue their routines without changes in personality or feed consumption. Consistency is especially important during transitions, so continue providing free-choice, high-quality, complete feed and fresh water.

Dominique

Weeks 9–14: A time of exploration

This is a time for your family to really get to know each bird's personality. During this time, birds are naturally inquisitive, will have high energy levels and enjoy exploring the backyard.

As you've done since day one, spend quality time with your flock to continue forming a bond. Help them grow strong and prepare for their first egg by keeping the coop and backyard comfortable.

Things to do during this time:

Allow chickens to explore. You can now start letting your chickens explore the backyard during the day. Before opening the coop, offer the flock their complete starter-grower feed and fresh water. Make sure they eat their breakfast before foraging in the yard for dessert. A complete feed should comprise at least 90 percent of their overall diet.

Train chickens to return to the coop. Growing birds will gain more confidence each day and start to explore new places. Train them to come back to the coop by offering treats and using vocal cues. Start with small periods of supervised time in the garden and work up to longer periods. Maintain a routine with how and when you let the chickens free-range.

Make your yard and garden chicken-friendly. Chickens are a great way to help control insects and weeds while providing natural fertilizer. Be aware that their foraging isn't limited to the plants you don't like. Protect your garden and flower beds with fencing. When harvest is over, you can then open the gates and let the chickens enjoy.

Keep them hydrated. For every seven birds, place one gallon of clean, cool water in a shaded area. Check water levels in the morning and evening and refill as necessary. Birds don't sweat, which makes drinking water important to help cool the birds' body temperatures. In warm temperatures, chickens will drink up to twice as much water as normal. If chickens do not have quality water, they are less likely to eat, which could stunt growth. Wash waterers weekly with a mixture of 10 percent bleach and 90 percent water. Rinse thoroughly.

Prepare for the first egg. Your first farm fresh egg is just around the corner, often happening at week 18. A rooster is not necessary for egg production. Prepare by setting up nesting boxes and choosing a complete layer feed.

Set-up nesting boxes. Provide at least one 1-foot cube nest box for every four hens. The hens will take turns using the boxes. Line each nest box with a thick layer of straw or other bedding to cushion the eggs and keep them clean and unbroken. Keep the nests up off the floor in the darkest corner of the coop. Be sure all the nest areas have a uniform environment. If the hens decide one nest is preferable to the others, they may all try to use that nest.

Offer a dust bath. Chickens take a different type of bath than you might expect. They often dig a shallow hole, loosen up all the dirt and then cover themselves in it. Dust baths can also prevent external parasites such as mites and lice.

Chicken Dust Bath DIY

- 1** Find a container at least 12" deep, 15" wide and 24" long.
- 2** Combine an equal blend of sand, wood ash and natural soil.
Optional: Add a smaller portion of food-grade diatomaceous earth to help with parasite control.
- 3** Watch your birds roll around in the bath and clean themselves!

Weeks 15–17: Egg-ticipation

Your pullets are nearing maturity and the first egg is just around the corner. Egg-producing pullets will typically begin laying at about 18 to 20 weeks and will need to be switched to a complete layer feed. Choose a layer feed today so you're ready for the transition at week 18.

Laying hens require 38 different nutrients to stay healthy and produce quality eggs. The biggest difference is calcium. It takes about 2 grams of calcium to form an eggshell each day. If the feed does not provide high enough calcium levels, hens may pull the nutrient from their bones, eventually causing a weak skeletal structure. Purina layer feeds that include Oyster Strong™ System are made to provide this necessary calcium, so there's no need to supplement with oyster shells.

Feathering and
egg production

Choosing a layer feed

The feed you select can also impact the nutrition profile of a hen's eggs. For added nutrition, look for a complete feed that includes omega-3. It's been shown that hens fed Layena® Plus Omega-3 can produce eggs with 250 mg omega-3 fatty acids per egg.¹

Lighting: At 16 weeks of age, it is time to get those ladies prepared for laying eggs. Egg laying is controlled by many things, but day length is key to getting your hens ready for laying. Increase their day length to 16 hours of light by supplementing the natural day length with one 40-watt bulb for each 100 square feet (10' x 10') of floor space. Set the light on a timer if necessary.

Roosters: Roosters do not need added calcium, like hens do. If you have a rooster, continue feeding him a complete feed that's high in protein, like Purina® Flock Raiser® crumbles or Purina® Organic Starter-Grower. Roosters can be fed in feeders placed higher or in a different area.

¹When fed a diet of Layena® Plus Omega-3 exclusively for at least 3 weeks. Based on large egg (56 g). Results may vary with factors such as total diet and hen health. A typical store bought egg contains 50 mg of Omega-3 fatty acids per large Egg (USDA: National Nutrient Base).

Week 18: Welcome to adulthood

Most laying breeds are considered adults when they turn 18 weeks. Most excitingly, this is the time when many hens will lay their first egg.

Things to do this week:

Introduce layer feed. When birds reach 18 weeks old or when the first egg arrives, slowly switch hens to a complete layer feed. It is important to make the transition over time to prevent digestive upset.

For our hens in Missouri, we mix the starter and layer feed evenly for four or five days. If birds are used to crumbles, start with a crumble layer feed. The same goes with pellets. The more similar the two feeds are, the more smoothly the transition should go. Once birds are not picking through the feeds, you can make the full switch to their complete layer feed.

Teach hens to lay in nesting boxes. After a hen begins laying eggs, it's her tendency to lay in the same spot moving forward. Create several comfortable, clean and cozy nesting areas to prevent hens from becoming competitive in the coop. Then, show hens to the nest boxes. Some hens may easily find the boxes themselves, while others may try to hide eggs in other places. Place a golf ball or fake eggs in the nesting boxes to give them the idea of where to lay.

Watch for your first egg. The first eggs may be irregular. They are sometimes small, have soft shells, have no yolks or double yolks. After a week or so, egg production should become more consistent, with peak performance at about 30 weeks of age.

Collect eggs frequently. Now it's time for the thrilling part of raising chickens: a daily treasure hunt for eggs! Gather eggs 2–3 times per day. Frequent egg gathering serves two purposes. First, it helps keep the eggs clean by reducing exposure to environmental bacteria and potentially eliminating the need for washing. Second, it lessens the opportunity for hens to learn the bad habit of egg eating. This is when a hen finds a broken egg, tastes it, likes it and begins breaking eggs.

Store eggs based on preference. The decision to refrigerate eggs is a personal preference. Eggs are laid with a protective layer called a cuticle, which helps keep bacteria out. This natural barrier means that eggs can remain unwashed and stored on the counter at room temperature.

Washing eggs removes the cuticle; therefore, washed eggs should be refrigerated to prevent contamination. If you choose to wash your eggs, be gentle and quick, using water only. Be sure to use water that is warmer than the egg. Dry and cool the eggs as quickly as possible.

Fresh eggs that are stored on the counter should be used within a few days, while refrigerated farm fresh eggs can typically last up to 30 days.

The first egg is a worthy time for a happy dance. Take a video and share it on our Facebook page!

Mature hens: It's egg-laying time

Now that your hens are laying, you've entered the fun phase that we like to call "pets with benefits!" Not only will your hens make you smile, they'll also make you breakfast. Take time to observe your farm fresh eggs. You'll likely notice vibrant yolks, stiff whites and exceptional flavor. You can begin to expect nearly one egg each day per laying hen. High-producing hens can lay up to 300 eggs per year; however, most hens will lay about 200–250 eggs.

Six eggs per week: It takes approximately 25 hours for a hen to produce one egg, so six eggs per week is an ideal goal. Breed, housing, weather, management, parasite load and nutrition can all affect your hen's rate of lay.

Feed them what they need: Hens are now channeling many of their nutrients into their eggs. Not only does flock nutrition impact the eggs they produce, it also contributes to each hen's overall health. To provide the nutrients she needs, continue feeding free-choice complete layer feed. Refill the feeders in the morning and evening.

A complete layer feed can also bring your eggs to the next level. For strong, protective shells, make sure your layer feed includes Purina's Oyster Strong™ System. The slow-release calcium breaks down slowly, so hens receive calcium when they need it most—when they are forming eggshells at night. If your complete layer feed does not include Oyster Strong™ System, supplement with oyster shells.

Another way to level-up your eggs is with omega-3. Hens are excellent at channeling nutrients from their feed into their eggs. By feeding Purina® Layena® Plus Omega-3, hens can produce eggs with 250 mg omega-3 fatty acids per egg.

**Eggs in photo laid by Buff Orpington
and Barred Rock hens**

²When fed a diet of Layena[®] Plus Omega-3 exclusively for at least 3 weeks. Based on large egg (56 g). Results may vary with factors such as total diet and hen health. A typical store bought egg contains 50 mg of Omega-3 fatty acids per large Egg (USDA: National Nutrient Base).

Introduce treats: Mature hens can be offered treats and snacks, like the Purina® Flock Block™, Purina® Scratch Grains or table scraps. Be sure to not overdo them, though. If you feed high levels of treats, hens will likely eat more of them than their fortified feed causing them to miss out on essential nutrients.

Consistent lighting: Egg production is impacted by light. When days get shorter, egg production naturally decreases. To maintain consistent performance, provide at least 16 hours of light per day with one incandescent 25- or 40-watt or LED 3-9 watt bulb per 100 square feet of coop space. Use an automatic timer to maintain a consistent sleep schedule.

Ensure cold weather comfort: Birds will spend more time inside the coop during fall and winter. Ensure a comfortable space and prevent boredom by providing 5–10 square feet per bird, adequate feed and water space, access to a dust bath, fun coop toys and a place for them to peck, like a Purina® Flock Block™.

Chickens, especially cold-tolerant breeds, can withstand winter temperatures without supplemental heat.

- Provide plenty of food and water that doesn't freeze.
- Keep the coop draft-free, but don't seal it completely. Some air needs to be exchanged to prevent ammonia buildup.
- Keep the coop dry. Remove any wet spots in the litter.
- If you feel it is necessary to provide a source of heat, only provide enough heat to raise the temperature a few degrees. The hens will adjust to the cold temperature.

Flock health: Through all ages, be sure to practice good flock biosecurity. Prevent access between wild birds and your flock and always wash your hands thoroughly after spending time with your birds. Bird symptoms of illness may include: decreased feed consumption, huddling, depression, closed eyes, respiratory signs (such as coughing and sneezing), watery greenish diarrhea, excessive thirst or swollen wattles and combs. Look for birds with their feathers fluffed out from their body. Be observant of your flock. Understand the personalities and mannerisms of your birds so that you will notice a change when something isn't right. If you notice any signs of illness, contact your local veterinarian. The earlier you can detect a problem, the easier it is to resolve.

Celebrate egg laying season by visiting your local Purina® retailer. Many stores host Purina® Flock-Tober® festivities each fall.

Year two and beyond

At this point, you've likely been bitten by the chicken lover's bug. You've joined thousands of American families who have fallen in love with backyard chickens. Caring for your adult hens will be similar to weeks 18–52, but here are a few new experiences to expect:

Chicken math: In the chicken world $1+1$ can equal 12. After conquering year one, it might be time to add new breeds and personalities to the flock. Keep new birds in a separate room or coop for 30 days to ensure they are disease-free. Work with the existing flock first and wash your hands between groups. Follow a similar quarantine plan for new chicks, as older hens can transmit disease to chicks and pullets. For chicks, though, the separation should last for 18 weeks or until both groups are mature. After the quarantine period, gradually introduce the new group of similar size and traits into the established flock. See page 21 for more tips. Always tend to the youngest birds first and move to the next oldest and so on.

Molt: Around 18 months, birds will likely go through their first molt. Often in late fall/early winter, hens will take an annual vacation from laying eggs and focus on replacing their feathers. Expect about 8–16 weeks of feather loss and regrowth each year.

Molting chickens need high protein levels for feather regrowth, so switch to Purina® Flock Raiser® or Purina® Organic Starter-Grower when you notice feather loss. Do not provide extra calcium as it can extend molt. When hens start laying again, transition back to your Purina® complete layer feed.

Retirement: Hens can lay eggs for up to five years and beyond. Continue feeding them a complete layer feed until egg production stops. When hens retire, they no longer need the added calcium and should then be switched back to a complete starter-grower feed, like Purina® Start & Grow® or Purina® Organic Starter-Grower. An all-flock feed, like Purina® Flock Raiser® crumbles will also work well.

Visit your local Purina® retailer or www.purinamills.com/chicken-feed for more in-depth management tips on caring for meat birds and mixed flocks.

Other fowl and mixed flocks

Chickens aren't the only birds that can be a part of your flock family. Backyard flocks may also include other fowl, like ducks, geese, turkeys, quail and meat birds.

Bird	Market (Meatbird)		To First Egg	
	Weeks	Feed*(lbs/bird)	Weeks	Feed*(lbs/bird)
Broiler	6	7–10	–	–
Layer	–	–	18-20	15–21
Duck	7–8	8–11	26	55–70
Goose	15–20	40–60	26	70–90
Turkey	14–18	60–100	28	110–220

Stay connected

We are happy to be with you each step of the way—celebrating memorable moments, answering questions and sharing in the joy of backyard chickens.

We would love to hear your story and share more flock fun with you online. Each of our channels offers a unique, educational experience. Please connect with us on the platforms that work best for you.

For additional and more in-depth chicken raising information, visit www.purinamills.com/chicken-feed.

Each poultry species is unique and should be cared for according to its unique needs. A quick feeding guide is included below for meat birds and mixed flocks.

Meat Production Feed	Egg Production Feed
Flock Raiser®	Layena®
Flock Raiser® then Start & Grow® Non-Medicated	Layena® or Gamebird Breeder Layena
Flock Raiser® then Start & Grow® Non-Medicated	Layena® or Gamebird Breeder Layena
Flock Raiser® then Start & Grow® Non-Medicated	Layena® or Gamebird Breeder Layena
Gamebird Starter then Flock Raiser®	Gamebird Breeder Layena

*Feed intakes are based on commercial production animals. Growth rates and feed intakes of heritage breeds are likely to be slower and higher, respectively.
